

JSON-LD Support for Property Graphs

W3C Data Workshop
Berlin, Germany – May 2019

Gregg Kellogg
@gkellogg (Twitter) #jsonld (W3C)

Position

- Anonymous Named Graphs match the use case.
 - RDF 1.1 defined named graphs, but not their semantics.
 - JSON-LD 1.0 provided support for graphs named by URI, but also without an explicit name (i.e., *blank* node)
 - The only reasonable interpretation of graphs named via blank node (anonymous named graphs) is that the blank node denotes the graph it names.
 - Statements made about the name of a named graph effectively are statements about that graph.
 - Note that *blank nodes* may be identified with a *blank node **identifier***, which people seem to hate. However, the notion that some nodes in a graph don't have an explicit name shouldn't be too controversial. By definition these are blank nodes.
