

JSON-LD – Key Features

- Add `@context` to JSON to associate terms (properties) with IRIs which define them.
 - Describe the expected types for string values of properties
 - IRI, Dates, Numbers, ...
 - Treat collections as lists or sets.
- Encourage the use of well-known identifiers for entities, and provide typing (`@id` and `@type`).
- (much more, see [JSON-LD 1.0](#) for a complete feature set).

JSON-LD 1.1 Mandate

- “Make JSON-LD even more like idiomatic JSON”
- Keys not Arrays
- Framing!
