

JSON-LD 1.1

- More generalized object indexing
- Properties can implicitly name anonymous graphs (“@container”: “@graph”).
- Property nesting.
- Recursive Lists (finally).
- Scoped Contexts (property or type) with control of propagation.
- Protected Term Definitions.
- Imported contexts.
- Framing on @id, more uniform frame matching semantics
- JSON Literals
- Deprecate Blank Node properties.
- Document-relative vocabulary mapping
- Normative HTML data-block extraction.
- Included Nodes.
- Poor-man’s content-negotiation (rel=alternate)
- Abstract from JSON-itself, allowing for YAML, CBOR and other LD representations.

Version Announcement

- For backwards compatibility, version 1.1 must be specified to use new 1.1 features (may be through API).

```
{
  "@context": {
    "@version": 1.1,
    "schema": "http://schema.org/",
    "name": "schema:name",
    "body": "schema:articleBody",
    "words": "schema:wordCount",
    "post": {
      "@id": "schema:blogPost",
      "@container": "@id"
    }
  },
  "@id": "http://example.com/",
  "@type": "schema:Blog",
  "name": "World Financial News",
  ...
}
```
